

# The Hello User Program

---

This is a very simple program that asks the user to input their name and their age.

It then says hello back to the user.

You will need to paste this into `main.py` to pass the tests.

You will see two squares in the right corner of the code snippet below when you hover over it with your mouse. Click this and the whole snippet will be copied.

```
name = input("Hello, what is your name?\n")
age = input("What is your age?\n")
print(f"Hello {name}, your age is {age}.")
```

Hit **Run** and have a play with this.

We see 3 things here that are of interest:

1. The `input()` function. This asks the user for some input via the console.
2. We assign (`=`) the input to a variable (`name` and `age`)
3. We print back out to the user using an f-string.

The next lesson on Simple I/O (Input/Output) will explain these in more detail.
