Exercise 1.1

In Python, you can print out the current date and time by using the datetime module.

```
import datetime

current_time = datetime.datetime.now()

print(f"The date and time is {current_time}")
```

Note the f in front of the string, this tells it to substitute the value of current_time into the string.

We will discuss modules later in the course, but they basically provide extra functionality for you to use.

You can print a blank line with,

```
print()
```

or with:

```
print("")
```

=== TASK ===

Copy the following into main.py.

```
import datetime

current_time = datetime.datetime.now()
print("The current date and time is {}".format(current_time))
```

Edit the code so that your program outputs the following:

```
Hello and Welcome to Programming in Python.
```

Python is a great general-purpose language and is used by the likes of Google and Facebook.

The current date and time is {YOU SHOULD PUT THE CURRENT DATETIME HERE}

Note that to pass the tests you must have exactly the output above, apart from the date and time.
