

Exercise 2.3

A ticket agency wants a program that will calculate the total cost of buying tickets for an event.

For the event in question, the cost of each ticket is as follows:

- Child tickets cost £5
 - Adult tickets cost £10
 - Senior tickets cost £8
-

=== TASK ===

Write a program that asks the user for the number of each ticket they require and calculates the total price.

Your program should output the following to the user,

```
Total Price: £X
```

where X is the total.

For example if the user inputted 3 child, 4 adult and 2 senior tickets the program output in the **console** will look like:

```
How many child tickets would you like?
3
How many adult tickets would you like?
4
How many senior tickets would you like?
2
Total Price: £71
```

Note that to pass the tests you must have exactly the output above, apart from the numbers which will differ depending on what the user inputs.
