

Exercise 2.5

A painter has decided that they want a program to calculate how much paint they need to cover a wall.

The length and height are specified in metres and the painter knows that 1 can of paint covers 20 square metres.

=== TASK ===

Create a program to calculate how many cans of paint will be needed to cover a wall of the length and height specified by the user.

Clearly if you needed 3.7 cans, your program should output 4 cans.

An example of the program for a length and height of 10 and 3 is given below.

```
Please enter the length of the wall:
10
Please enter the height of the wall:
3
You require 2 cans of paint.
```
