

Exercise 4.2

The distance a vehicle travels can be calculated as follows:

$\text{Distance} = \text{Speed} \times \text{Time}$

For example, if a train travels 40 miles per hour for three hours, the distance travelled is 120 miles.

=== TASK ===

Write a program that asks the user for the speed of a vehicle (in miles per hour) and the number of hours it has travelled.

It should then use a loop to display the distance the vehicle has travelled for each hour of the time period.

Here is an example of the required output:

```
What is the speed of the vehicle in mph?
40

How many hours has it travelled?
3

Hour | Distance Travelled
-----
1    | 40
2    | 80
3    | 120
```

Make sure that you use spaces to format your table so it matches the output of the test.

You will have to probably experiment with the **tests** to get the format correct.

Note that to pass the tests you must have exactly the output above, apart from the numbers which will differ depending on what the user inputs.
