

Exercise 4.4

=== TASK ===

Write a program that asks the user for the triangle size they wish to display.

It should then display a triangle created out of asterisks based on the size entered.

For example, for a request of 6, the required output is:

```
Please enter the size (no of rows) of the triangle you wish to display:
6
*
**
***
****
*****
*****
```

HINT: You can repeat a string by multiplying it. e.g.

```
print("hello"*3)
```

outputs:

```
hellohellohello
```

OR you can stop python printing a newline using the `end` parameter. e.g.

```
print("hello", end="")
print("hello", end="")
print("hello", end="")
```

also outputs:

```
hellohellohello
```

If you want to challenge yourself, the second way is harder.

Note that to pass the tests you must have exactly the output above, apart from the numbers which will differ depending on what the user inputs.
